MATCHA

MATCHA'S ANATOMY: KNOW THE COMPONENTS

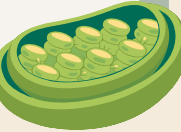

Amino L-theanine

- non-protein amino acid
- mainly in tea leaves & mushrooms
- high levels: sweet + umami

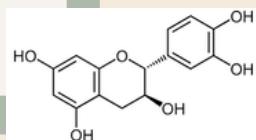

Chlorophyll

- green pigments found in leaves of all plants
- grassy, earthy & bitter taste

Catechins (EGCG)

- polyphenols (flavonoid)
- adds mild bitterness

Dimethyl Sulfide

- metabolite
- contributes to umami

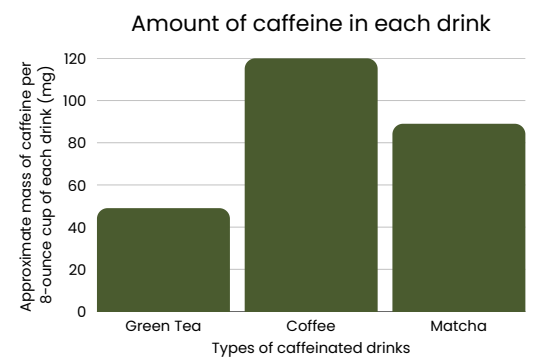

BENEFICIAL CHEMICAL COMPOUNDS IN MATCHA

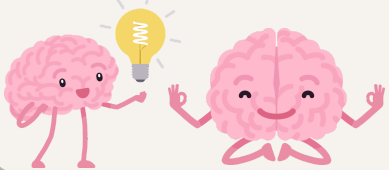

CAFFEINE

- blocks adenosine (sleep inducing) in brain
- stimulates the production of neurotransmitters (e.g. adrenaline and dopamine) → increases alertness and focus

L-THEANINE

- affect GABA, dopamine & serotonin, + blocks glutamate (excitatory)
 - stimulates alpha brain waves (8-12 Hz) → focus yet relaxed
- in conjunction with caffeine to prevent jitteriness

EGCG

- donates of e^- to stabilize free radicals prevent oxidative damage
- affects signal pathways (e.g. JAK/STAT), regulate cell cycle - ~~cancer~~

IT "TASTE LIKE GRASS" WHY?

Shade-Grown Cultivation:

Weeks before harvest, plants are covered to block direct sunlight. This:

- inhibits photosynthesis
-  L-theanine production
- L-theanine  tannins
- Chlorophyll content increases

NOT TOO PERFORMATIVE !

Over-consumption leads to:

- Over caffeination
 - Anxiety, digestive issues, disrupted sleep
- Low iron → tannin binds to iron in body, harder to absorb iron
- Too much EGCG → liver issues
