

CLIMATE CHANGE

Climate change is a disruption of Earth's energy balance, where increased greenhouse gases trap outgoing heat, increasing the planet's internal energy. It alters the thermodynamic equilibrium of the Earth system, causing long-term shifts in temperature, weather, and climate patterns

CLIMATE CHANGE BY THE NUMBERS

0.24°C

mean temperature rise per decade

STATISTICS

68%

of greenhouse gases are caused by fuel emissions

FACTS ABOUT CLIMATE CHANGE!

- 20% of global greenhouse gases are due to deforestation
- In 2024, the average concentration of carbon dioxide (CO₂) in our atmosphere was 421.73 ppm, the highest in human history
- Global surface temperature has increased faster since 1970 than in any other 50-year period over at least the last 2000 years
- Adaptation to climate change safeguards people from higher temperatures, rising seas, fiercer storms, unpredictable rainfall and more acidic oceans

STATISTICS

90%

Amount of heat from global warming that the ocean absorbed

30%

Carbon absorbed by the ocean from all human activities

48%

The rate at which sea levels are rising

SOLUTIONS

Recycle old items

Use more public transport

Say no to single-use plastics

Plant trees & support reforestation projects
