

PLATYPUS

AN INTERESTING CREATURE.

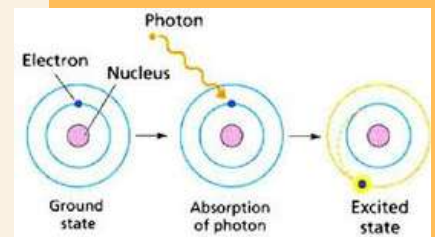

- Native to Australia, they are one of the only egg-laying mammals
- Males have spurs in their hind foot that delivers venom
- Baby platypuses are called puggles
- Have a sense of electroreception

Did you know?

Platypus' fur emits a cyan glow under UV light!

Photoluminescence: proteins or pigments (fluorophore) in platypus fur have a HOMO-LUMO gap that corresponds to the energy of the visible region. The fluorophore absorbs short-wavelength and high-energy UV light invisible to the human eye. The absorbed energy excites the electrons in the molecules. when the electrons return to their normal state, the some energy is re-emitted as longer-wavelength and lower-energy light (Stoke's shift) that falls within the visible spectrum and results in a cyan colour.

Fun fact: The platypus is depicted on the back of the Australian 20¢ coin

Platypus depicted in cartoons such as Perry from the American television show Phineas and Ferb
